

The iUni & iDuo Process

Should you and your surgeon determine you are a good candidate for the iUni or iDuo, your surgeon will give you an order for a CONFORMIS knee scan at a local CT imaging center.

Your CT scan will be sent to CONFORMIS for review and implant production. Your iUni or iDuo should be available in approximately six to eight weeks from receipt of the scan.

The personalized implant will be shipped to your surgeon along with personalized surgical instruments derived from your CT scan, called iJigs™. The iJigs will guide the surgeon in determining the precise placement of your implant.

Following surgery, your care will focus on reducing and controlling swelling, pain management and physical therapy. You may wear a brace for a few weeks.

Your surgeon and physical therapist will also prescribe exercises and activities to strengthen your knee muscles. While every person is different, patients are generally able to walk and weight-bear within 2 weeks following surgery. You should expect to feel significant pain relief within 2–3 months of your procedure and should be able to return to most activities within 3–6 months. In some cases, full recovery may take longer than 6 months, particularly for demanding physical activities.

For optimal recovery, activities that stress the knee should be resumed slowly and only as tolerated, allowing your knee adequate time to adapt to the implant.

- Manufactured for each patient, based on their individual anatomy
- Minimally invasive, minimally traumatic procedure
- Bone and cartilage preserving
- Potential for less post-operative pain and shorter postoperative recovery
- Preserves the ability to move to other treatment options in the future
- Unique iJig™ instruments facilitate precise fit and less traumatic surgery

iUni™ & iDuo™ Resurfacing Implants

*Unique Solutions
for Unique Patients*

A personalized, less-traumatic approach to the treatment of osteoarthritis of the knee

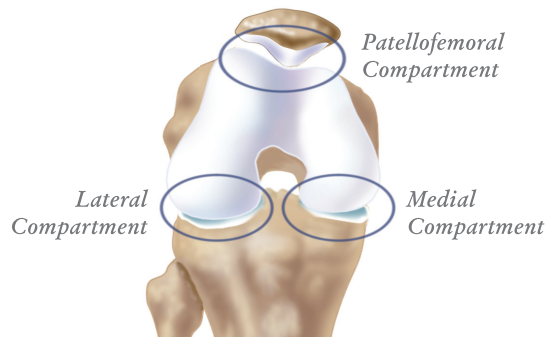

CAUTION: USA Federal Law restricts the use of these devices to sale by or on the order of a physician. iJig, iFit, iUni and iDuo are trademarked by CONFORMIS, Inc.

A Treatment Alternative

Osteoarthritis (OA) is the most common form of arthritis, affecting tens of millions worldwide. If you and your doctor have already tried conservative options such as NSAIDs, corticosteroids, and viscosupplementation, you may be considering total knee replacement surgery. For many patients, a less invasive, less traumatic option may be a viable alternative.

Partial Knee Resurfacing

Your knee consists of three “compartments” or sections: medial, lateral and patellofemoral. Traditional total knee replacement surgery replaces all three with a metal implant. It also requires significant bone removal which can limit your future treatment options, a major concern for young adults with active lifestyles.

Partial knee resurfacing offers a bone-preserving option for those affected with OA in only one or two compartments. Rather than replace all three compartments, partial knee procedures target only those compartments actually affected by disease.

The unique CONFORMIS approach provides notably more bone preservation than traditional knee replacement by *resurfacing* rather than removing healthy bone. Patients are able to preserve the knee for future treatment options and may also experience faster recovery time and reduced post-operative pain than traditional total knee replacement surgery.

The Patient-Specific Advantage

Typical knee implants require your surgeon to choose from a variety of standard sized implants and cut your bones to fit the implant. Because every patient is different, surgeons have historically had to “make do” with implants that do not fit each patient’s unique anatomy perfectly, even with significant bone cutting.

CONFORMIS has developed the only *personalized* partial knee implants available today, designed to conform precisely to your own unique knee anatomy. Using a proprietary technology called iFit™ (the “i” stands for individualized), CONFORMIS creates implants that are made specifically for each individual.

Personalized implants offer unique advantages versus traditional knee replacement. Because each CONFORMIS device is created specifically for you, the implant exactly mirrors the surface contours of your knee. The implant provides an anatomical fit with far less bone cutting than traditional options. In addition, improved fit and alignment may reduce implant wear and extend longevity.

The CONFORMIS iFit technology has been applied to create two patient-specific partial knee resurfacing implants: the iUni and iDuo.

CONFORMIS Partial Knee Implants
